TRACK 03 • AUTONOMOUS AI TEAMMATES

Paytm Vyapar AI

An AI teammate that turns unpaid invoices into tracked, accountable collections.

RECONCILE • PRIORITIZE • FOLLOW UP • VERIFY

Prepared by Priyansh Agarwal

Concept-stage proposal • Synthetic-data MVP • No production access assumed

01 / PROBLEM

Small businesses don’t just need to get paid. They need payment follow-through.

Receivables work is fragmented across invoices, bank exports, messages and human memory.

RAZORPAY FIX MY ITCH

Two adjacent pain points

82.8 — **Small businesses struggle to negotiate favourable payment terms with large buyers.**

Source problem score: 82.8

67.5 — **Why do micro-SMEs waste 10+ hours weekly on invoice management?**

Source problem score: 67.5

Scores are from Razorpay’s problem bank, not Paytm judging scores or market-size estimates.

TODAY’S BROKEN LOOP

01 **Invoice scattered**
Sheets, PDFs and chat threads

02 **Payment matching is manual**
Partial payments and unclear references

03 **Follow-ups slip**
Promises to pay live in memory

Result: missed commitments, admin load and uncertain cash position.

02 / PROPOSED SOLUTION

A receivables teammate that closes the loop.

It moves from invoice visibility to a verified next action — with humans in control of consequential steps.

INGEST

Bring records together

Import invoices and transaction exports. Keep each record linked to its source.

01

RECONCILE

Match with evidence

Apply amount, date, reference and customer checks. Flag ambiguous matches.

02

TAKE ACTION

Prepare follow-ups

Draft context-aware Hindi, Hinglish or English reminders for owner approval.

03

CLOSE LOOP

Track to completion

Record promises, schedule next steps and stop reminders after verified payment.

04

DESIGN RULE **The model writes language and selects tools; the ledger establishes payment facts.**

03 / ILLUSTRATIVE DEMO

From a partial payment to the right next action.

Sample case • Synthetic values • No live payment or customer data

INVOICE R-104

ABC Stores

Original invoice	₹25,000
Verified partial payment	– ₹10,000
Outstanding balance	₹15,000

12 DAYS OVERDUE

AGENT EXECUTION TIMELINE

1. **Match payment evidence**
   ₹10,000 is matched; invoice remains partially paid.
2. **Draft a respectful reminder**
   “Invoice R-104 ka ₹15,000 balance pending hai. Kya aap Friday tak payment confirm kar sakte hain?”
3. **Record promise and wait for evidence**
   Friday promise is tracked; when the ledger confirms payment, the reminder is cancelled.

Successful completion = ledger evidence + case update + reminder stopped.

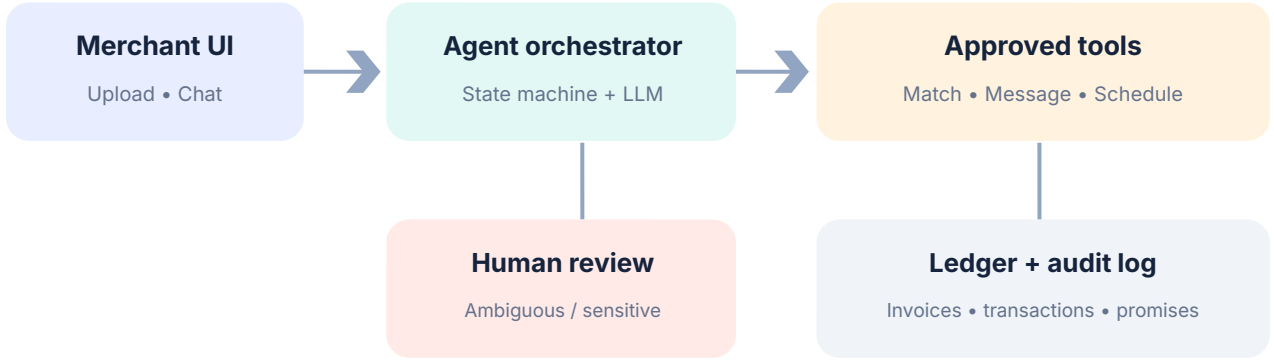

Illustrative flow only — sample invoice, customer, balances and message.

04 / TECHNOLOGY

A practical, tool-using agent — not a black-box finance bot.

The LLM handles language and workflow intent. Deterministic services own matching, arithmetic and status transitions.

SYSTEM FLOW

Core principle: the model cannot invent a transaction state or directly issue a refund.

PROPOSED MVP STACK

FRONTEND	**React**
API	**Python + FastAPI**
AGENT	LLM function calling + explicit state machine
STORAGE	SQLite first; PostgreSQL if needed
INTEGRATIONS	CSV upload + sandbox messaging adapter

Prototype uses synthetic records. Production payment, banking and messaging access are not assumed.

05 / USP

Built for safe action, not just fluent chat.

The product is designed to be useful when the data is messy — and honest when it cannot verify an outcome.

01

Evidence before assertion

A “paid” status requires a matching transaction record. Amounts and balances come from deterministic code, not generated text.

02

Automation with boundaries

Owner approval for outbound messages, rate limits, opt-out handling and a human gate for disputes or ambiguous matches.

03

Persistent execution

Promises-to-pay, follow-up dates and action logs survive between conversations and external events.

FAILURE BEHAVIOUR IS PART OF THE PRODUCT

Payment feed unavailable	Mark status unverified; pause automation; queue review.
Ambiguous transaction match	Do not auto-close; ask for evidence or owner review.
Payment verified	Update balance; close case; cancel scheduled reminder.

06 / IMPACT & BENEFITS

Measure fewer missed steps — not vanity AI metrics.

Prototype evaluation plan • results will be measured, not assumed

MATCH QUALITY

Payment-match precision

Labelled synthetic test set; track false matches.

SAFETY

False payment closures

Target: zero auto-closures without evidence.

TASK COMPLETION

Correct next action

Measure correct reminders, review and follow-up decisions.

EFFICIENCY

Time per case

Measure median time from import to queued action.

MERCHANT BENEFIT

Less invoice administration • Fewer missed promises • Clearer outstanding cash position

Pilot plan: 50–100 synthetic invoices/transactions + 30–50 test complaints; publish results by scenario and failure type.

07 / BUSINESS MODEL

Start with collections operations. Expand only after the workflow proves reliable.

An integration-light pilot can validate value before asking merchants to change their accounting stack.

PHASE 1

Single-merchant pilot

CSV import • synthetic/demo ledger • owner-approved reminders

PHASE 2

SME workflow integration

Connect accounting and messaging tools where permissions allow; evaluate operator time saved.

PHASE 3

Platform distribution

Potential channel through merchant platforms / partners, subject to integration and validation.

PROPOSED BUSINESS MODEL

B2B SaaS: tiered monthly fee by invoice volume / active merchant, with usage-based messaging add-ons.

WHY THIS FITS PAYTM

Extends merchant value beyond acceptance: a trusted workflow companion for receivables, follow-ups and service operations.
